## 1 Chapter 2

This note is based on *An Introduction to Tensors and Group Theory for Physicists* by Nadir Jeevanjee.

| Section 1. Chapter 2

### 1.1 2.1

Prove that  $L^2([-a, a])$  is closed under addition. You will need the triangle inequality, as well as the following inequality, valid for all  $\lambda \in \mathbb{R} : 0 \leq \int_{-a}^a (|f| + |g|)^2 dx$ .

**Proof.** Suppose  $f, g \in L^2([-a, a])$ , let  $\lambda = -1$ , and we have

$$2 \int_{-a}^a |f||g| dx \leq \int_{-a}^a |f|^2 dx + \int_{-a}^a |g|^2 dx < \infty, \quad (1.1)$$

so

$$\int_{-a}^a (|f| + |g|)^2 dx = \int_{-a}^a (|f|^2 + |g|^2 + 2|f||g|) dx < \infty. \quad (1.2)$$

Using the triangle inequality, we have

$$\int_{-a}^a |f + g|^2 dx \leq \int_{-a}^a (|f| + |g|)^2 dx < \infty. \quad (1.3)$$

So  $L^2([-a, a])$  is closed under addition.  $\square$

### 1.2 2.2

In this problem we show that  $\{r^l Y_m^l\}$  is a basis for  $\mathcal{H}_l(\mathbb{R}^3)$ , which implies that  $\{Y_m^l\}$  is a basis for  $\tilde{\mathcal{H}}_l(\mathbb{R}^3)$ .

(a) Let  $f \in \mathcal{H}_l(\mathbb{R}^3)$ , and write  $f$  as  $f = r^l Y(\theta, \phi)$ . Then we know that

$$\Delta_{S^2} Y = -l(l+1)Y, \quad (1.4)$$

where

$$\Delta_{S^2} = \frac{\partial^2}{\partial \theta^2} + \cot \theta \frac{\partial}{\partial \theta} + \frac{1}{\sin^2 \theta} \frac{\partial^2}{\partial \phi^2}. \quad (1.5)$$

If you have never done so, use the expression for  $\Delta_{S^2}$  and the expression for the angular momentum operators to show that

$$-\Delta_{S^2} = L_x^2 + L_y^2 + L_z^2 \equiv \mathbf{L}^2, \quad (1.6)$$

where

$$\begin{aligned} L_x &= -i \left( y \frac{\partial}{\partial z} - z \frac{\partial}{\partial y} \right), \\ L_y &= -i \left( z \frac{\partial}{\partial x} - x \frac{\partial}{\partial z} \right), \\ L_z &= -i \left( x \frac{\partial}{\partial y} - y \frac{\partial}{\partial x} \right). \end{aligned}$$

so that (1.4) says that  $Y$  is an eigenfunction of  $\mathbf{L}^2$ , as expected. You will need to convert between cartesian and spherical coordinates. The theory of angular momentum then tells us that  $\mathcal{H}_l(\mathbb{R}^3)$  has dimension  $2l + 1$ .

**Proof.** We need to express the cartesian coordinates  $\{x, y, z\}$  and the corresponding derivatives  $\{\partial_x, \partial_y, \partial_z\}$  in terms of spherical coordinates

$$\begin{aligned} x &= r \sin \theta \cos \phi, & y &= r \sin \theta \sin \phi, & z &= r \cos \theta, \\ r &= \sqrt{x^2 + y^2 + z^2}, & \theta &= \arccos \frac{z}{r}, & \phi &= \arctan \frac{y}{x}. \end{aligned}$$

Hence

$$\begin{aligned} df &= \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy + \frac{\partial f}{\partial z} dz \\ &= \frac{\partial f}{\partial r} dr + \frac{\partial f}{\partial \theta} d\theta + \frac{\partial f}{\partial \phi} d\phi \\ &= \left( \frac{\partial f}{\partial r} \right)_{\theta, \phi} \left( \frac{\partial r}{\partial x} dx + \frac{\partial r}{\partial y} dy + \frac{\partial r}{\partial z} dz \right) \\ &\quad + \left( \frac{\partial f}{\partial \theta} \right)_{r, \phi} \left( \frac{\partial \theta}{\partial x} dx + \frac{\partial \theta}{\partial y} dy + \frac{\partial \theta}{\partial z} dz \right) \\ &\quad + \left( \frac{\partial f}{\partial \phi} \right)_{r, \theta} \left( \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz \right) \end{aligned}$$

where we need to take care of what variables are kept constant when we take the partial derivatives, because we have two sets of variables  $(x, y, z)$  and  $(r, \theta, \phi)$ . It is not difficult to show

$$\begin{aligned} \left( \frac{\partial r}{\partial x} \right)_{y, z} &= \frac{x}{r}, & \left( \frac{\partial r}{\partial y} \right)_{x, z} &= \frac{y}{r}, & \left( \frac{\partial r}{\partial z} \right)_{x, y} &= \frac{z}{r}, \\ \left( \frac{\partial \theta}{\partial x} \right)_{y, z} &= \frac{\cos \theta \cos \phi}{r}, & \left( \frac{\partial \theta}{\partial y} \right)_{x, z} &= \frac{\cos \theta \sin \phi}{r}, & \left( \frac{\partial \theta}{\partial z} \right)_{x, y} &= -\frac{\sin \theta}{r}, \\ \left( \frac{\partial \phi}{\partial x} \right)_{y, z} &= -\frac{\sin \phi}{r \sin \theta}, & \left( \frac{\partial \phi}{\partial y} \right)_{x, z} &= \frac{\cos \phi}{r \sin \theta}. \end{aligned}$$

Therefore we have

$$\begin{aligned}
 \frac{\partial f}{\partial x} &= \left( \frac{\partial r}{\partial x} \right)_{y,z} \left( \frac{\partial f}{\partial r} \right)_{\theta,\phi} + \left( \frac{\partial \theta}{\partial x} \right)_{y,z} \left( \frac{\partial f}{\partial \theta} \right)_{r,\phi} + \left( \frac{\partial \phi}{\partial x} \right)_{y,z} \left( \frac{\partial f}{\partial \phi} \right)_{r,\theta} \\
 &= \left( \sin \theta \cos \phi \frac{\partial}{\partial r} + \frac{\cos \theta \cos \phi}{r} \frac{\partial}{\partial \theta} - \frac{\sin \phi}{r \sin \theta} \frac{\partial}{\partial \phi} \right) f, \\
 \frac{\partial f}{\partial y} &= \left( \frac{\partial r}{\partial y} \right)_{x,z} \left( \frac{\partial f}{\partial r} \right)_{\theta,\phi} + \left( \frac{\partial \theta}{\partial y} \right)_{x,z} \left( \frac{\partial f}{\partial \theta} \right)_{r,\phi} + \left( \frac{\partial \phi}{\partial y} \right)_{x,z} \left( \frac{\partial f}{\partial \phi} \right)_{r,\theta} \\
 &= \left( \sin \theta \sin \phi \frac{\partial}{\partial r} + \frac{\cos \theta \sin \phi}{r} \frac{\partial}{\partial \theta} + \frac{\cos \phi}{r \sin \theta} \frac{\partial}{\partial \phi} \right) f, \\
 \frac{\partial f}{\partial z} &= \left( \frac{\partial r}{\partial z} \right)_{x,y} \left( \frac{\partial f}{\partial r} \right)_{\theta,\phi} + \left( \frac{\partial \theta}{\partial z} \right)_{x,y} \left( \frac{\partial f}{\partial \theta} \right)_{r,\phi} + \left( \frac{\partial \phi}{\partial z} \right)_{x,y} \left( \frac{\partial f}{\partial \phi} \right)_{r,\theta} \\
 &= \left( \cos \theta \frac{\partial}{\partial r} - \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} \right) f,
 \end{aligned}$$

Now we can calculate the angular momentum operators in spherical coordinates

$$\begin{aligned}
 L_x &= -i \left( y \frac{\partial}{\partial z} - z \frac{\partial}{\partial y} \right) = i \left( \sin \phi \frac{\partial}{\partial \theta} + \cot \theta \cos \phi \frac{\partial}{\partial \phi} \right), \\
 L_y &= -i \left( z \frac{\partial}{\partial x} - x \frac{\partial}{\partial z} \right) = -i \left( \cos \phi \frac{\partial}{\partial \theta} - \cot \theta \sin \phi \frac{\partial}{\partial \phi} \right) \\
 L_z &= -i \left( x \frac{\partial}{\partial y} - y \frac{\partial}{\partial x} \right) = -i \frac{\partial}{\partial \phi},
 \end{aligned}$$

and we define the ladder operators  $L_{\pm} = L_x \pm iL_y$ , so we have

$$L_{\pm} = e^{\pm i\phi} \left( \pm \frac{\partial}{\partial \theta} + i \cot \theta \frac{\partial}{\partial \phi} \right). \quad (1.7)$$

and

$$\begin{aligned}
 \mathbf{L}^2 &\equiv L_x^2 + L_y^2 + L_z^2 \\
 &= L_+ L_- + i[L_x, L_y] + L_z^2 \\
 &= L_+ L_- + L_z^2 - L_z \\
 &= -\frac{\partial^2}{\partial \theta^2} - \cot \theta \frac{\partial}{\partial \theta} - \frac{1}{\sin^2 \theta} \frac{\partial^2}{\partial \phi^2}.
 \end{aligned}$$

where we use  $L_z = i[L_x, L_y]$ . □

- (b) Exhibit a basis for  $\mathcal{H}_l(\mathbb{R}^3)$  by considering the function  $f_0^l \equiv (x + iy)^l$  and showing that

$$L_z(f_0^l) = lf_0^l, \quad L_+(f_0^l) \equiv (L_x + iL_y)(f_0^l). \quad (1.8)$$

The theory of angular momentum then tells us that  $(L_-)^k f_0^l \equiv f_k^l$  satisfies  $L_z f_k^l = (l - k)f_k^l$  and that  $\{f_k^l\}_{0 \leq k \leq 2l}$  is a basis for  $\mathcal{H}_l(\mathbb{R}^3)$ .

**Proof.** Rewrite  $f_0^l$  in spherical coordinates

$$f_0^l = r^l \sin^l \theta e^{il\phi}. \quad (1.9)$$

Hence

$$L_z f_0^l = -i \frac{\partial f_0^l}{\partial \phi} = l f_0^l. \quad (1.10)$$

Apply ladder operators to  $f_0^l$ , we have

$$\begin{aligned} L_+(f_0^l) &= e^{i\phi} \left( \frac{\partial}{\partial \theta} + i \cot \theta \frac{\partial}{\partial \phi} \right) (r^l \sin^l \theta e^{il\phi}) \\ &= r^l e^{i\phi} e^{il\phi} (l(\sin \theta)^{l-1} \cos \theta - l \cot \theta \sin^l \theta) = 0. \end{aligned}$$

□

### 1.3 Exercise 2.6

Suppose  $V$  is finite-dimensional and let  $T \in \mathcal{L}(V)$ . Show that  $T$  being one-to-one is equivalent to  $T$  being onto. Feel free to introduce a basis to assist you in the proof.

**Proof.** Choose a basis  $\mathcal{B} = \{e_1, e_2, \dots, e_n\}$  of  $V$ , and  $\dim V = n$ .

1. Given  $T$  is one-to-one, we can prove that  $\mathcal{B}' = \{T(e_i)\}$  is also a basis of  $V$ , i.e.,  $\mathcal{B}'$  is independent and spans  $V$ .

We write the linear relation for  $T(e_i)$

$$\sum_{i=1}^n c_i T(e_i) = 0. \quad (1.11)$$

Because  $T$  is linear, we can also write

$$T(c_j e_j) = T\left(-\sum_{i \neq j} c_i e_i\right). \quad (1.12)$$

Given  $T$  is injective, we have

$$c_j e_j = -\sum_{i \neq j} c_i e_i, \text{ or } \sum_{i=1}^n c_i e_i = 0. \quad (1.13)$$

Then  $c_i = 0$  for  $i = 1, 2, \dots, n$ , because  $\mathcal{B}$  is linear independent. Hence  $\mathcal{B}'$  is linear independent. Since the number of elements of  $\mathcal{B}'$  is  $n$ ,  $\mathcal{B}'$  is also a basis of  $V$ .

For any vector  $w \in V$ , we can expand it in basis  $\mathcal{B}'$ , such that

$$w = \sum_{i=1}^n a_i T(e_i) = T\left(\sum_{i=1}^n a_i e_i\right) = T(v), \quad (1.14)$$

where  $v = \sum_i a_i e_i \in V$ . Hence  $\exists v \in V$ , such that  $w = T(v)$ , so  $T$  is onto.

2. Given  $T$  is onto, for any  $w \in V$ , there exists  $v$  such that  $w = T(v)$ . If we want to show  $T$  is also one-to-one, then we need to prove such  $v$  is unique. We use proof

by contradictions. Suppose  $\exists v_1 \neq v_2$ , such that  $w = T(v_1) = T(v_2)$ . Because  $T$  is linear, we have

$$T(v_1) - T(v_2) = T(v_1 - v_2) = 0. \quad (1.15)$$

Write  $v_{1,2}$  in basis  $\mathcal{B}$

$$\begin{aligned} v_1 &= \sum_{i=1}^n c_{1i} e_i, & v_2 &= \sum_{i=1}^n c_{2i} e_i, \\ v_1 - v_2 &= \sum_{i=1}^n c_i e_i \neq 0. \end{aligned}$$

where  $c_i = c_{1i} - c_{2i}$ , and there exists some  $j \in \{1, 2, \dots, n\}$  such that  $c_j \neq 0$  because  $v_1 - v_2 \neq 0$ . Hence (1.15) can be written as

$$\sum_{i=1}^n c_i T(e_i) = 0, \quad \exists j \in \{1, 2, \dots, n\} \text{ such that } c_j \neq 0, \quad (1.16)$$

which means  $\mathcal{B}' = \{T(e_i)\}$  is linearly dependent,  $\dim(\mathcal{B}') < n$ , so there exists  $w' \notin V$ , with  $w'$  can not be express in terms of a linear combination of basis  $\mathcal{B}'$ . In other words, we cannot find such  $v' = \sum_i a_i e_i \in V$  such that  $w' = \sum_i a_i T(e_i) = T(v')$ . This contradicts our assumption that  $T$  is onto. Therefore  $v_1 = v_2 = v$  is unique once we are given a  $w \in V$ . In other words

$$w = T(v_1) = T(v_2) \implies v_1 = v_2, \quad (1.17)$$

if  $w \in \text{Span}(\mathcal{B}')$ , then  $v \in \text{Span}(\mathcal{B})$ , i.e. (1.17) is true for all  $v_1 = v_2 \in V$ . Eventually we prove that  $T$  is one-to-one. □

## 1.4 Exercise 2.7

Suppose  $T(v) = 0 \implies v = 0$ . Show that this is equivalent to  $T$  being one-to-one.

**Proof.** Write  $v = v_1 - v_2$ , because  $T$  is linear

$$T(v) = T(v_1 - v_2) = T(v_1) - T(v_2) = 0 \implies v = v_1 - v_2 = 0. \quad (1.18)$$

Hence  $T$  is one-to-one. □

## 1.5 Exercise 2.10

By carefully working with the definitions, show that the  $e^i$  defined in (2.18) and satisfying (2.20) are linearly independent.

**Proof.** For any vector  $v \in V$  such that

$$v = \sum_{i=1}^n v^i e_i, \quad (1.19)$$

a dual vector  $e^i$  is defined by

$$e^i(v) \equiv v^i. \quad (1.20)$$

If  $v = e_j = \sum_i \delta_j^i e_i$ , then  $e^i(e_j) = \delta_j^i$ . We are well-prepared to prove  $\mathcal{B}^* = \{e^i\}$  is linearly independent.

First we write a linear relation for  $\{e^i\}$

$$\sum_{i=1}^n c_i e^i = 0 \quad (1.21)$$

where  $c_i \in C$  is a scalar. Remember that  $e^i$  is a  $C$ -valued function on  $V$ , so if we apply this linear relation (1.21) on any vector  $v \in V$ , we must still have zero. Let  $v = e_j$ , where  $j = 1, 2, \dots, n$ , then

$$\sum_{i=1}^n c_i e^i(e_j) = \sum_{i=1}^n c_i \delta_j^i = c_j = 0. \quad (1.22)$$

In other words the linear relation (1.21) is true, unless all  $c_i = 0$ . Therefore  $\mathcal{B}^*$  is linear independent.  $\square$

## 1.6 Exercise 2.11

Let  $(\cdot|\cdot)$  be an inner product. If a set of non-zero vectors  $e_1, \dots, e_k$  is orthogonal, i.e.  $(e_i|e_j) = 0$  when  $i \neq j$ , show that they are linearly independent. Note that an orthonormal set (i.e.  $(e_i|e_j) = \pm \delta_{ij}$ ) is just an orthogonal set in which the vectors have unit length.

**Proof.** Similar to the previous exercise, we write a linear relation for  $e_1, \dots, e_k$

$$\sum_{j=1}^k c^j e_j = 0. \quad (1.23)$$

We have the following inner product between  $e_i$  ( $i = 1, 2, \dots, k$ ) and the left hand side of the linear relation

$$\left( e_i \left| \sum_{j=1}^k c^j e_j \right. \right) = c^i (e_i|e_i) = 0. \quad (1.24)$$

Notice that  $(e_i|e_i) > 0$  since  $(\cdot|\cdot)$  is an inner product, so we must have  $c^i = 0$  where  $i = 1, 2, \dots, k$ . Hence  $\{e_1, \dots, e_k\}$  is linear independent.  $\square$

## 1.7 Exercise 2.12

Let  $A, B \in M_n(\mathbb{C})$ . Define  $(\cdot|\cdot)$  on  $M_n(\mathbb{C})$  by

$$(A|B) = \frac{1}{2} \text{Tr}(A^\dagger B). \quad (1.25)$$

Check that this is indeed an inner product. Also check that the basis  $\{I, \sigma_x, \sigma_y, \sigma_z\}$  for  $M_2(\mathbb{C})$  is orthonormal with respect to this inner product.

**Proof.** Condition 1, linearity in the second argument

$$\begin{aligned}(A|cB) &= \frac{1}{2} \operatorname{Tr}(A^\dagger cB) \\ &= c \frac{1}{2} \operatorname{Tr}(A^\dagger B) \\ &= c(A|B).\end{aligned}$$

Condition 2, Hermiticity

$$\begin{aligned}\overline{(B|A)} &= \frac{1}{2} \operatorname{Tr}[(B^\dagger A)^\dagger] \\ &= \frac{1}{2} \operatorname{Tr}(A^\dagger B) \\ &= (A|B).\end{aligned}$$

Condition 4, positive-definiteness

$$(A|A) = \frac{1}{2} \operatorname{Tr}(A^\dagger A) = \frac{1}{2} \sum_{i,j} |a_{ij}|^2 > 0 \quad \text{if } A \neq 0. \quad (1.26)$$

Condition 4 implies condition 3 (non-degeneracy), so this is indeed a inner product. As for the basis of  $H_2(\mathbb{C})$ , recall the property of Pauli matrices

$$\sigma_i \sigma_j = i\epsilon_{ijk} \sigma_k + \delta_{ij}, \quad (1.27)$$

which can be derived from

$$[\sigma_i, \sigma_j]_- = 2i\epsilon_{ijk} \sigma_k, \quad [\sigma_i, \sigma_j]_+ = 2\delta_{ij}. \quad (1.28)$$

Hence

$$(\sigma_i|\sigma_j) = \frac{1}{2} \operatorname{Tr}(\sigma_i \sigma_j) = \delta_{ij}. \quad (1.29)$$

And it is easy to show

$$(I|\sigma_j) = 0, \quad (I, I) = 1. \quad (1.30)$$

Therefore the basis  $\{I, \sigma_x, \sigma_y, \sigma_z\}$  for  $H_2(\mathbb{C})$  is orthonormal with respect to this inner product.  $\square$
